Active Reconnaissance Report

1. Objective

The objective of this work was to learn active reconnaissance techniques for gathering information about a target through direct interaction.

2. Concept and Understanding

Active reconnaissance involves directly interacting with a target. It can provide more thorough information; however, this activity is detectable by the target.

Techniques covered

- **Port scanning** — finding open ports.
- **Service detection** — identifying running services.
- **Banner grabbing** — obtaining service and software information.
- **Operating system fingerprinting** — identifying the target operating system.
- **Vulnerability scanning** — finding known security issues.

3. Practical Work

I completed the TryHackMe Active Recon room. Through this practical work, I learned how to:

- Perform port scanning with Nmap.
- Detect service versions.
- Grab service banners.
- Identify operating systems.
- Interpret scan results.

4. Tools Used

The following tools and platform were used during the practical work:

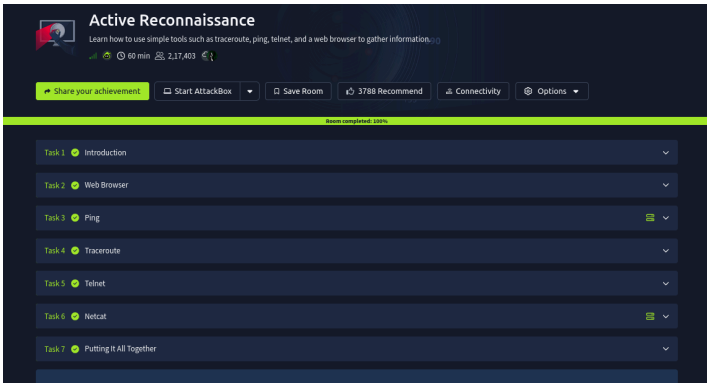

- TryHackMe
- Nmap
- Netcat
- curl

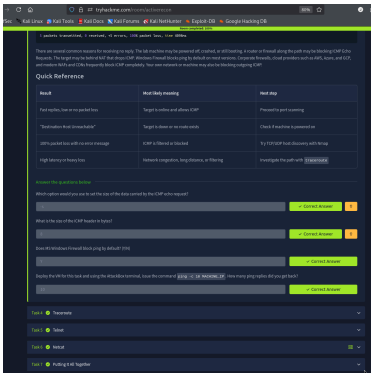

---

5. Evidence

The evidence associated with the practical work consists of:

1. Active Recon room completion. 2. Correct answers in the room.

6. Result

I learned how to actively scan targets and identify the services running on them.

---

7. Key Learnings

- **Detectability** — Active reconnaissance is detectable by the target.
- **Port scanning** — Nmap is an essential tool for port scanning.
- **Service information** — Service versions can reveal potential vulnerabilities.
- **Operating system detection** — Identifying the operating system helps inform security-testing plans.
- **Banner grabbing** — Service banners can reveal useful software information.
