CONTENT DISCOVERY REPORT

1. Objective

To learn how to discover hidden files, directories, and endpoints on a web application.

---

2. Concept/Understanding

Content discovery is finding resources that are not linked publicly.

Techniques

- **Directory brute forcing** — Trying common directory names
- **File brute forcing** — Finding backup files and config files
- **Parameter discovery** — Finding hidden parameters
- **Robots.txt analysis** — Reading allowed/disallowed paths
- **Sitemap analysis** — Finding listed pages
- **Wayback Machine** — Finding old pages

---

3. Practical Work

I completed the TryHackMe Content Discovery room. I learned:

- How to use Gobuster for directory brute forcing
- How to find hidden files
- How to analyze robots.txt
- How to use wordlists
- How to discover API endpoints

---

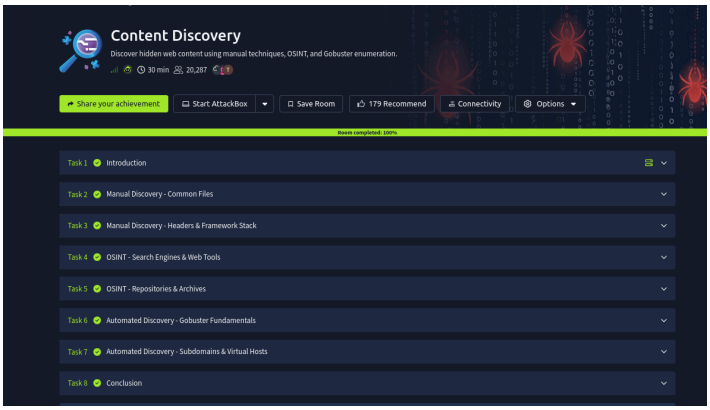

4. Tools Used

- TryHackMe
- Gobuster
- ffuf
- curl
- Browser

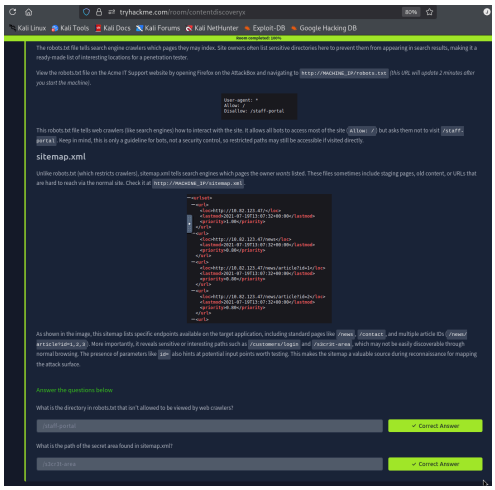

---

5. Evidence

1. Content Discovery room completion

2.Correct answers in the room

---

6. Result

Learned to find hidden content on web applications.

---

7. Key Learnings

- **Hidden directories** often contain sensitive data
- **robots.txt** reveals interesting paths
- **Wordlists** are essential for brute forcing
- **Backup files** can leak source code
- **Content discovery** expands attack surface
