Passive Reconnaissance Report

1. Objective

To learn passive reconnaissance techniques for gathering information about a target without directly interacting with it.

---

2. Concept/Understanding

Passive recon means collecting information about a target without touching their systems. This leaves no trace.

Techniques:

- **WHOIS lookup** — Domain registration info
- **DNS records** — A, MX, TXT records
- **Subdomain discovery** — Finding hidden subdomains
- **Google dorking** — Using search operators
- **Shodan** — Searching for exposed devices
- **SSL/TLS certificates** — Finding subdomains from certs

---

3. Practical Work

I completed the TryHackMe Passive Recon room. I learned:

- How to perform WHOIS lookups
- How to query DNS records
- How to find subdomains passively
- How to use search engines for recon
- How to analyze SSL certificates

---

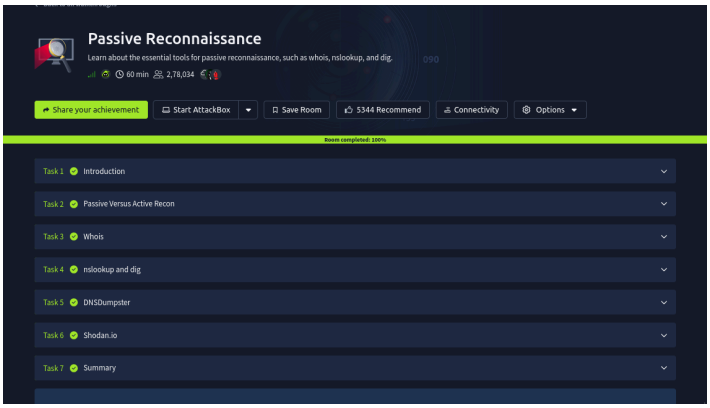

4. Tools Used

- TryHackMe
- WHOIS
- Nslookup / Dig
- crt.sh
- Google

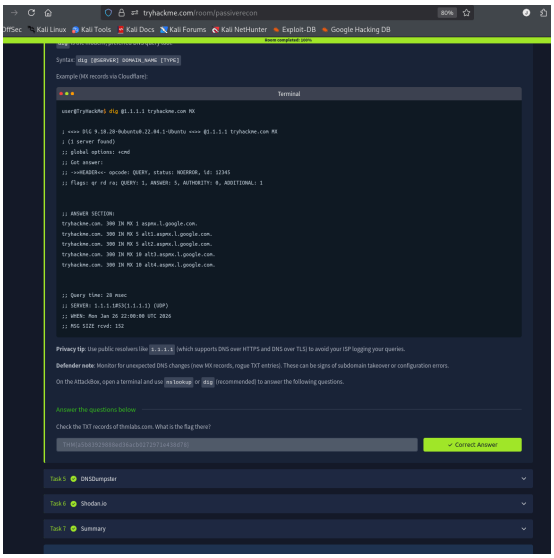

---

5. Evidence

1. **Passive Recon room completion**

2.Correct answers in the room

---

6. Result

Learned to gather information about targets without direct interaction.

---

7. Key Learnings

- Passive recon leaves no traces
- WHOIS reveals domain ownership
- DNS records expose infrastructure
- Certificates can reveal subdomains
- Search engines are powerful recon tools
