WEB FUNDAMENTALS

1. Objective

The objective of this task was to understand how web applications work and how HTTP communication happens between a browser and a web server.

---

2. Concept/Understanding

Web Application Basics:

A web application has three main parts:

- Client - The browser (Chrome, Firefox) that sends requests
- Server - The computer that hosts the website and responds
- Database - Where all data is stored

When you visit a website:

1. Browser sends a request to the server
2. Server processes the request
3. Server sends back a response
4. Browser displays the page

HTTP in Detail:

HTTP (HyperText Transfer Protocol) is how browsers and servers communicate.

HTTP Methods:

- GET - Get data from server
- POST - Send data to server
- PUT - Update data
- DELETE - Delete data

HTTP Status Codes:

- 200 = OK
- 301 = Moved
- 403 = Forbidden
- 404 = Not Found
- 500 = Server Error

Headers:

Extra information sent with requests and responses.

Cookies and Sessions:

- Cookies = data stored in browser
- Sessions = data stored on server

---

3. Practical Work

I completed two TryHackMe rooms:

- Web Application Basics
- HTTP in Detail

I also used browser Developer Tools (F12) to inspect:

- Network requests
- Headers
- Cookies
- Status codes

---

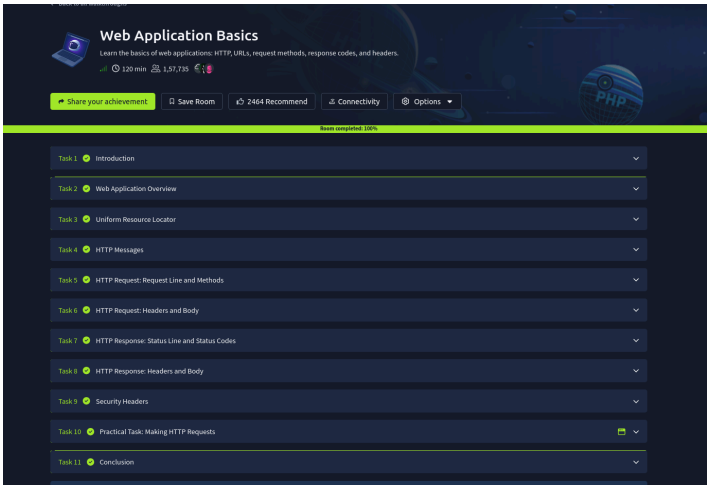

4. Tools Used

- TryHackMe
- Google Chrome
- Developer Tools (F12)

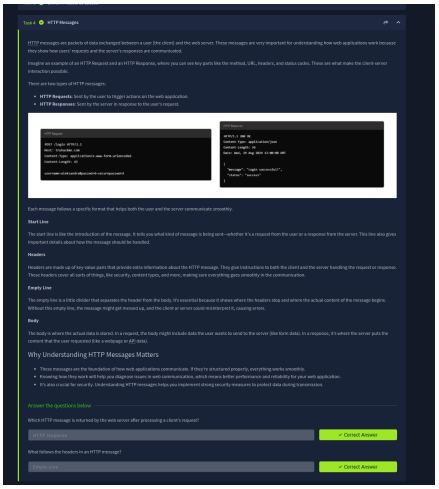

---

5. Evidence

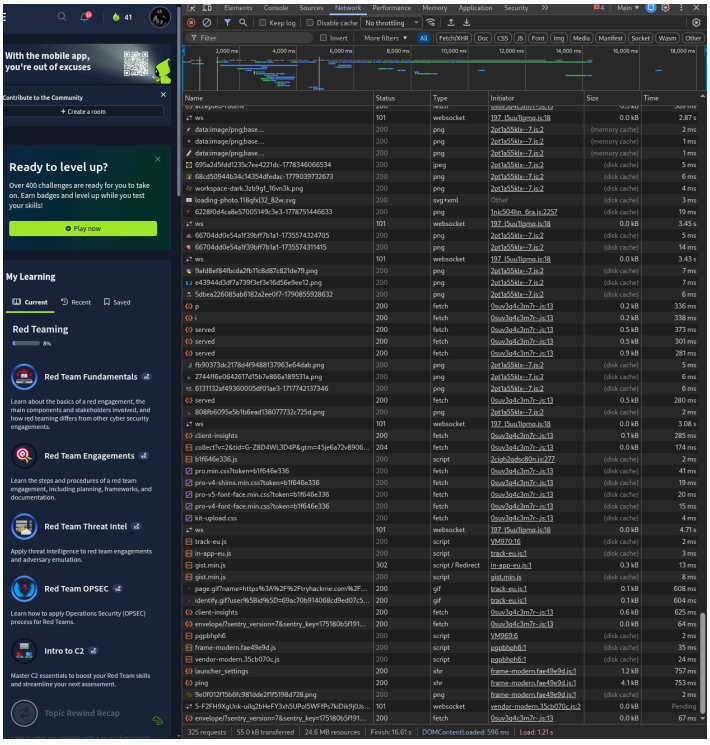

1. **Web Application Basics room completion**

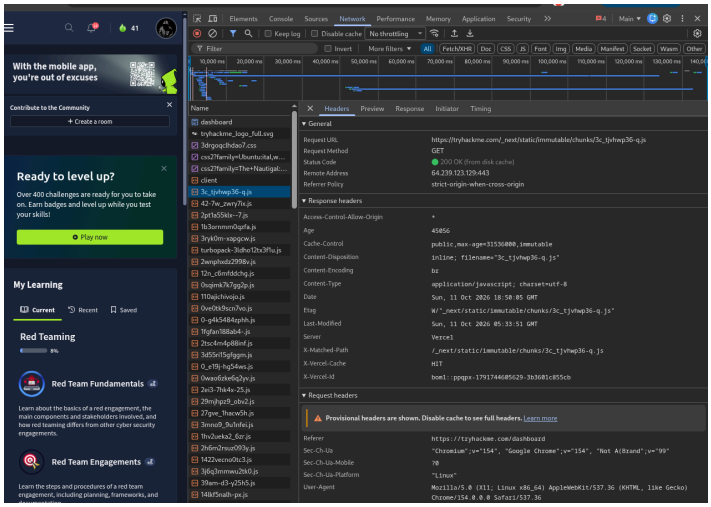

2. **Correct answers in the room**

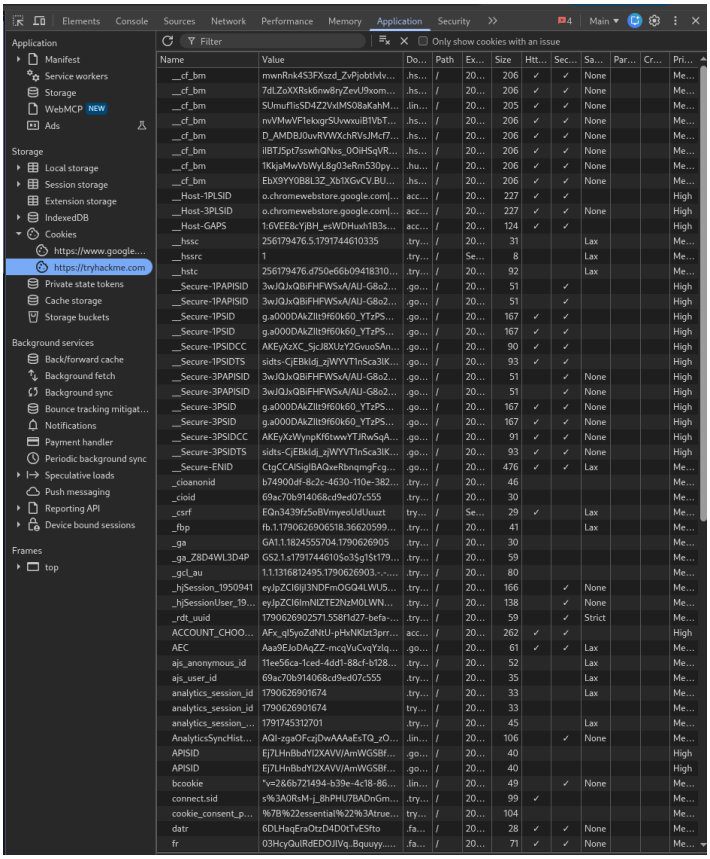

3. **Network tab showing HTTP requests**

3. **Request and Response headers**

5. **Cookies stored in browser**

6. **HTTP status codes**

---

6. Result

I learned:

- How web applications are structured
- How HTTP requests and responses work
- What headers, cookies, and status codes mean
- How to inspect web traffic using Developer Tools

---

7. Key Learnings

- Every website uses HTTP to communicate
- Cookies help websites remember you
- Status codes tell you what happened with a request
- Developer Tools let you see everything happening behind the scenes
- Understanding HTTP is the first step in web security
